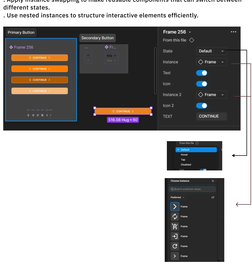
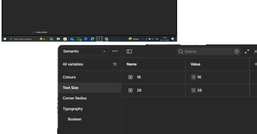
Building an Interactive Prototype with Variants, Variables, and Dev Handoff

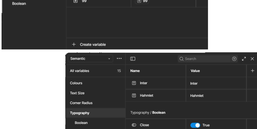
Q1. Create an interactive prototype in Figma that includes dynamic UI components with variants, instance swapping, and nested instances.

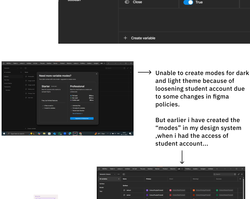
Q2. Use variants to design multiple states of components such as buttons, toggles, or form elements.
. Apply instance swapping to make reusable components that can switch between different states.
. Use nested instances to structure interactive elements efficiently.



Q3. Implement variables (string, colour, number, Boolean) and apply them dynamically in the prototype.
. Use colour and mode variables to create a light/dark theme toggle.



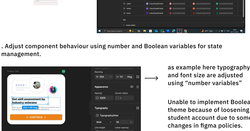




Unable to create modes for dark and light theme because of loosening student account due to some changes in figma policies.

But earlier i have created the "modes" in my design system ,when i had the access of student account...

. Adjust component behaviour using number and Boolean variables for state management.

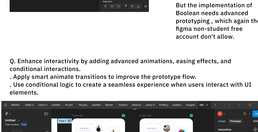


as example here typography and font size are adjusted using "number variables"

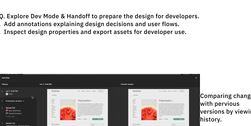
Unable to implement Boolean theme because of loosening student account due to some changes in figma policies.

But the implementation of Boolean needs advanced prototyping , which again the figma non-student free account don't allow.

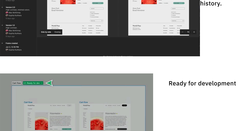
Q. Enhance interactivity by adding advanced animations, easing effects, and conditional interactions.
. Apply smart animate transitions to improve the prototype flow.
. Use conditional logic to create a seamless experience when users interact with UI elements.



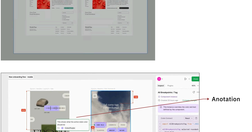
Q. Explore Dev Mode & Handoff to prepare the design for developers.
. Add annotations explaining design decisions and user flows.
. Inspect design properties and export assets for developer use.



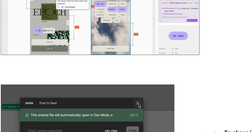
Comparing changes with pervious versions by viewing history.



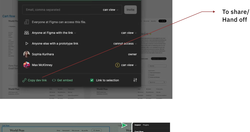
Ready for development



Anotation



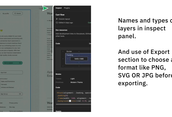
To share/ Hand off



Names and types of layers in inspect panel.

And use of Export section to choose a format like PNG, SVG OR JPG before exporting.

Exporting Asset...



In the right sidebar, scroll to the bottom → Export section.
1. Click the "+" icon.
2. Choose:
- Format: PNG / JPG / SVG / PDF (SVG for icons, PNG/JPG for images)
- Scale: 1x, 2x, 3x (for different screen resolutions)
- Optional: Rename the file in the export settings.
